

Anaplastic thyroid cancer

Anaplastic thyroid cancer is rare (1-5% of thyroid cancers). It usually affects people over 60-70 years of age. This type of tumor is characterized by rapid growth of the tumor node, invasion of the environment and mechanical syndrome (from oppression). It creates early distant metastases (nodes , lungs , liver , CNS).

Therapy

- Radical surgery (total thyroidectomy),
- palliation - cytostatics + external irradiation .
- often only symptomatic treatment .

Prognosis

- Unfavorable, median survival 5 months.
