

Bile duct tumors

Benign tumors

- Rare,
- papillomas, polyps - the essence is fibromas, lipomas, granulomas; ...,
- they can become obstructive and need to be removed.

Malignant tumors

- It is most often a medullary carcinoma.
- They infiltrate the bile duct or are in the papilla (it is difficult to decide whether they come from the bile duct, duodenum or pancreatic duct).
- Unfortunately, it is worse in the upper parts - they are often diagnosed late (Klatskin's tumor).
- **Clinical image** – intermittent painless obstructive icterus/jaundice with loss of appetite, weight loss.
- **Therapy:**
 - papillary tumor - hemiduodenopancreatectomy;
 - tumors of the strain:
 - resection and anastomosis of the bile duct into the GIT;
 - but more often palliative - choledochoduodenoanastomoses.
