

Brachial artery

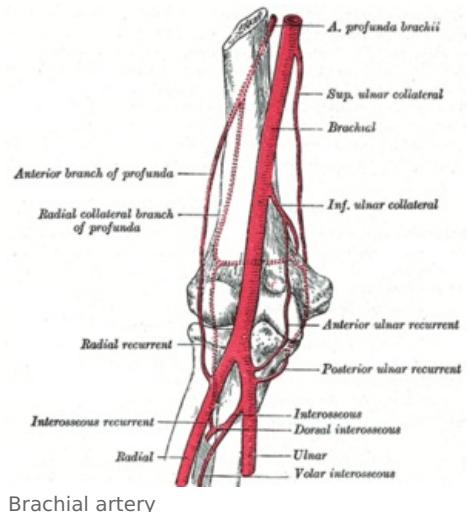

Arteria brachialis is continuation *a. axillaris* from collum chirurgicum humeri. It takes place in the anterior osteofacial space of the arm in the *sulcus bicipitalis medialis*.

It branches out a strong branch of the **a. profunda brachii**, which accompanies the *n. radialis* in *sulcus nervi radialis*, between the heads of the *m. triceps brachii*. It also branches out **arteria collateralis ulnaris superior and inferior**.

On the front of the forearm in the *fossa cubitalis* at *collum radii* it divides into *a. radialis* and *a. ulnaris*. It supplies the arm and elbow joint.^[1]
