

# Burkholderia

The genus Burkholderia belongs to the so-called gram-negative non-fermenting bacteria , it belongs to this group together with the genus Burkholderia genera showing similar characteristics as this genus, they are the genus Pseudomonas and the genus Stenotrophomonas . Due to their common characteristics and traits, these genera can be put into context, in the medical sense, these genera are important mainly in terms of nosocomial diseases .

## Taxonomy

The taxonomy of the genus Burkholderia is constantly renewed, the current classification is as follows:

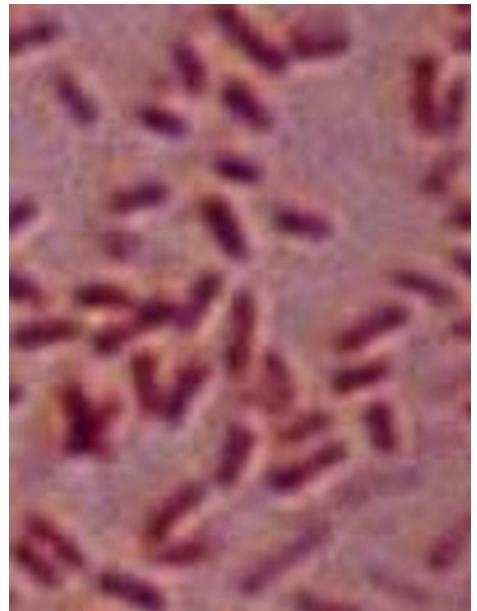

- class Betaproteobacteria ,
- Order of the Burkholderiales ,
- family Burkholderiaceae ,
- genus Burkholderia ,
- The genus includes several species of bacteria, the most important of which include:
  - *Burkholderia cepacia* ,
  - *Burkholderia mallei* ,
  - *Burkholderia pseudomallei* .

## Burkholderia cepacia

[edit embedded article]

<i>Burkholderia cepacia</i>	
<i>Burkholderiaceae</i>	
<i>Burkholderia</i>	
<i>Burkholderia cepacia</i>	
<b>Morphology</b>	G -
<b>Cultivation</b>	selective soils to exclude <i>Pseudomonas aeruginosa</i> colony growth, <i>Burkholderia cepacia</i> agar
<b>Disease</b>	nosocomial infections (especially of the respiratory tract, in patients with cystic fibrosis)
<b>Diagnostics</b>	cultivation of suitable biological material
<b>Therapy</b>	piperacillin, tazobactam , ceftazidime , carbapenems , fluoroquinolones
<b>MeSH ID</b>	D016956

*Burkholderia cepacia* is a bacterium originally parasitizing on garlic plants. It is currently gaining in importance as a causative agent of nosocomial infections . High resistance to hospital disinfectants such as Ajatin, Septonex or chlorhexidine makes it exceptional. The bacteria can bind atmospheric carbon dioxide and thanks to this property it can also multiply in distilled water. *B. cepacia* produces exo substances that damage macroorganisms.

It is especially dangerous for patients with artificial heart valves or vascular implants and for patients with cystic pulmonary fibrosis . Among other things, it contributes to infections of the urogenital tract of women caused by nosocomial transmission via a gel used for gynecological examination. Effective treatment has been demonstrated with piperacillin and its protected variants with tazobactam , as well as with ceftazidime , carbapenems or fluoroquinolones . Cultivation of *Burkholderia cepacia* is not demanding, but selective soils are used to exclude the growth of the *Pseudomonas aeruginosa* colony .

## Taxonomy

The taxonomy of the genus Burkholderia is constantly renewed, the current classification is as follows:

- class Betaproteobacteria
- order Burkholderiales
- family Burkholderiaceae
- genus Burkholderia

# Burkholderia mallei

[✎ edit embedded article]

<i>Burkholderia mallei</i>	
<i>Burkholderiaceae</i>	
<i>Burkholderia</i>	
Colonies of <i>Burkholderia mallei</i> on blood agar	
<b>Morphology</b>	Good bar
<b>Relation to oxygen</b>	strictly aerobic
<b>Cultivation</b>	common cultivation soils
<b>Transmission</b>	direct contact with a sick animal, inhalation of contaminated dust or aerosol
<b>Incubation time</b>	1-14 days
<b>Disease</b>	fever (acute, chronic)
<b>Diagnostics</b>	cultivation (in case of clinical suspicion, notify the laboratory in advance), serological and skin tests
<b>Therapy</b>	acute: carbapenems, ceftazidime, co-trimoxazole, fluoroquinolones, doxycycline; chronic: up to several months administration
<b>MeSH ID</b>	D042726

*Burkholderia mallei* - microscopically *Burkholderia mallei* is an exception among other genera, it is a stationary gram-negative rod. It occurs mostly in the tropics and subtropics and can be brought to us from these areas. It causes a disease of solipeds called malleus . When transmitted to humans, it often has lethal consequences.

# Burkholderia pseudomallei

[✎ edit embedded article]

<i>Burkholderia pseudomallei</i>	
<i>Burkholderiaceae</i>	
<i>Burkholderia</i>	
Colonies of <i>Burkholderia pseudomallei</i> on blood agar	
<b>Morphology</b>	Good bar
<b>Relation to oxygen</b>	strictly aerobic
<b>Cultivation</b>	common cultivation soils
<b>Virulence factors</b>	polysaccharide capsule
<b>Transmission</b>	inhalation of contaminated dust, skin abrasion, ingestion of contaminated water
<b>Occurrence</b>	saprophytically in soil and water
<b>Incubation time</b>	2 days to several months
<b>Disease</b>	melioidosis (acute, subacute, chronic)
<b>Diagnostics</b>	cultivation (blood culture, pus, tissue), serology, skin tests
<b>Therapy</b>	severe: piperacillin, tazobactam, carbapenems, ceftazidime; lighter forms: chloramphenicol, doxycycline, fluoroquinolones
<b>MeSH ID</b>	D016957

*Burkholderia pseudomallei* is atypical of our destination, occurring mainly in the tropics and subtropics of Southeast Asia, but also in northern Australia. This bacterium causes melioidosis or pseudomalleus in humans and animals. The course of the disease can be different, asymptomatic, chronic and acute. Untreated melioidosis is 95% fatal .
