

Internal capsule

The internal capsule descends from the center semiovale between the thalamus and basal ganglia.

- leads most cortical centripetal and centrifugal fibers
 - in the horizontal section it has the shape of an externally open V - between the arms there is ncl. lentiformis (putamen + globus pallidus)

Description

- **crus anterius** - anterior arm between *caput nuclei caudati* and *ncl. lentiformis* - tr. fronto-pontinus
 - **gene** - knee - tractus corticonuclearis (for facial muscles)
 - **crus posteriorius** - posterior arm between *thalamus* a *ncl.lentiformis* - corticospinal tract (for limb and torso muscles), tr. cortico-rubralis, tr. cortico-reticularis
 - **pars retro Lenticularis** - enlarged part dorsally from *ncl. lentiformis* - tr. parieto-occipito-pontinus, radiatio optica a austica (end of the visual and auditory pathway)
 - *in the crus anterius + gene + crus posteriorius the fibers connecting the thalamus and the cortex run - radiatio thalami anterior, superior et posterior*
 - *capsula externa (between putamen and claustrum) and capsula extrema (between claustrum and insular cortex) extend from the internal capsule*
 - during bleeding in the area of the internal capsule - the diagnosis is determined according to the typical symptoms of damage to individual pathways
