You can read our help articles or simply ask anyone from the editorial board. We are ready to help you!

The article talks mostly about a situation in a health facility. Needs generalization – any person/human can be a source of infection, not just a „patient“ or „employee“. Simply changing the term would not do – parts of the text are specific for a health facility – keep them as example for a health facility environment but revise the text as such into more general. Use information from your teacher's text available at the webpage of the Institute of Hygiene & Epidemiology of the 1st Faculty of Medicine UK: Schejbalová M. Introduction to epidemiology of infectious diseases. Available at [http://hygold.lf1.cuni.cz/mat\\_en/04\\_Epid\\_Statist/Introduction\\_to\\_epidemiology\\_of\\_infection\\_diseases.pdf](http://hygold.lf1.cuni.cz/mat_en/04_Epid_Statist/Introduction_to_epidemiology_of_infection_diseases.pdf) Make a note about the difference about what means „a source“ in Czech literature (man, animal, exceptionally environment e.g. legionella) and in English. Explain what is fomite – if used. In our understanding a fomite is not a source of infection. Add sources/reference literature that you used. --MUDr. Eva Kudlová, CSc. 09:37, 14 March 2012 (CET)
