

# Transplantation

**Transplantation** refers to the transfer of tissues or whole organs.

1. *autotransplantation* – transfer from the same individual; the greatest probability of permanent graft attachment
2. *alotransplantation* (homotransplantation) – transfer from another individual of the same species
3. *xenotransplantation* (heterotransplantation) – transfer from an individual of another species (e.g. pig skin)
4. *isotransplantation* – transfer from a monozygotic, immunobiologically identical twin (equivalent to autotransplantation)

If we use a foreign material for the replacement, then it is alloplasty.
