

Trendelenburg's sign

This article has been translated from WikiSkripta; ready for the **editor's review**.

Template:Heslo

Leaning of the pelvis when the innervation of abductors and internal rotators in the hip is affected. This is mainly a weakening of the gluteus medius muscle and the gluteus minimus muscle in superior gluteus nerve paralysis or L5 radiculopathy. These muscles normally act as pelvic stabilizers. When standing on the affected lower limb, the pelvis tilts towards the healthy side due to their weakening. When walking, it creates a typical image of the so-called *duck walk* = **Trendelenburg gait**.

File:Trendelenburg-příznak.png

Morbus Perthes is manifested by Trendelenburg's sign. Changing the position of the trochanter and muscles.
