

Elastic artery (histological slide)

Histological description

The wall of an elastic artery consists of three basic layers: *Tunica intima*, *T. media*, *T. adventitia*, examples of elastic arteries are large arteries (**Aorta**, **A.subclavia**, **Arteria carotis communis** and others.).

Tunica intima

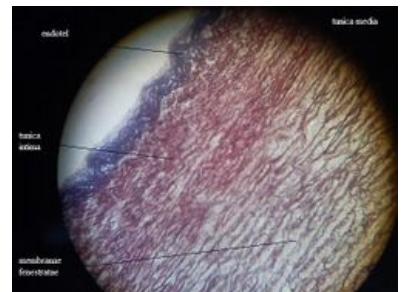

Endothelium (single-layer squamous epithelium), lamina elastica interna.

Tunica media

In this layer, parallel arranged elastic membranes (light in HE staining) and layers of smooth muscle (dark) alternate, smooth muscle cells have a nucleus in the center (visible only at maximum magnification), lamina elastica externa is difficult to distinguish.

Tunica adventitia

It contains numerous *vasa vasorum*.

Aorta longitudinally. This stain (Wiegert's resorcin-fuchsin) stains elastin dark purple. This will highlight the elastic membranes.

Aorta transversely
