

# Fossa iliopectinea

The iliopectinea fossa, a fossa in the proximal part of the thigh on the anterior side lying at the depth of the trigonum femorale, is a topographic space bounded by m. iliopsoas (laterally), m. pectineus (medially) and fascia iliopectinea (dorsally forming the bottom between the two muscles). There are structures from the lacuna vasorum of the inguinal landscape – a. femoralis together with v. femoralis.
