

Guyon's canal

Guyon's canal (*canalis ulnaris*) is found on the ulnar side of the hand distal to the *canalis carpi*.

Boundaries:

- **proximal:** *hiatus proximalis* (opening in the *lig. carpi palmarum*, approximately at the level of the proximal edge of the *os pisiforme*, through which the *n. et vasa ulnaria* from under the superficial fascia of the forearm to the subcutaneous tissue). The surface edge of the opening is reinforced in the so-called *crus superficiale*, the deeper edge borders the *crus profundum*;
- **distal:** *hiatus distalis* (below the fibrous arch connecting the beginning of the *m. flexor digiti minimi* to the *hamulus ossis hamati* with the beginning *m. abductor digiti minimi* on the *os pisiforme*), in this opening they dive in *r. profundus n. ulnaris* and *rr. profundi vasorum ulnarium* into the deep, while *r. superficialis n. ulnaris* and *rr. superficiales vasorum ulnarium* run through this arch further distal to the IV. and V. finger;
- **ulnarily:** *os pisiforme*, further distally also the beginnings of the hypotenar muscles;
- **radially:** *hamulus ossis hamati*;
- **bottom:** *retinaculum musculorum flexorum* (separates Guyon's canal from the carpal tunnel), *lig. pisohamatum et pisometacarpale*;
- **ceiling:** subcutaneous ligament, further distally *m. palmaris brevis*.

Content:

- **n. ulnaris et vasa ulnaria** (so it goes through the Guyon canal above *lig. carpi transversum* – outside of the carpal canal).
