

# Lower abdominal pain syndrome

The lower abdominal syndrome can be divided:

- Painful right lower abdomen syndrome.
- Lower left abdominal pain syndrom

The pain in the lower left abdomen can have several causes. It depends on the body structures that project into this area.

## 1. Left-sided renal colic

Renal colic

## 2. Bowel obstruction, ileus

- Often caused by rectosigma cancer, which is found in elderly patients with a long history of digestive problems (constipation, alternation of constipation with diarrhea, enterorrhea).
- **Clinical picture:** sudden pain in the left lower abdomen with bloating, lack of flatulence and bowel movement, vomiting missing or late, palpable tumor may be present
- **Dg.:** X-ray native standing (ileose image), event. short colonoscopy after barium enema.

## 3. Ulcerative colitis

- The disease is often known from a personal history, also IBD(Inflammatory Bowel Disease) in the family history.
- Pain occurs during exacerbation of inflammation and perforation of ulcers (with subsequent limited or diffuse peritonitis).
- **Clinical picture:** acute pain in the left lower abdomen with diarrhea with blood and mucus

## 4. Diverticular Disease (diverticulitis)

- **Clinical picture:**
  - Typical are colic-like pains in the left lower abdomen, caused by spasms of the colon muscle or actual obstruction, or perforation of an inflamed diverticulum with peritonitis.
  - There are bloody diarrhea with mucus, fever and high CRP. Diagnosis: colonoscopy, but up to 6-8 weeks after inflammation has subsided.
- **Therapy:**
  - uncomplicated diverticulitis is treated with a diet (residue-free diet), i.v. administration of antibiotics (e.g. Amoxiclav i.v. + Entizol supp.)
  - complications are solved surgically (diverticulum perforation, ileus)

## 5. Other causes

- Left-sided appendicitis
- Adnexitis
- Ectopic pregnancy
