

Nonthrombotic sources of pulmonary embolism

Fat embolism

thumb|250px|Tuková embolie

- Post up to $\frac{1}{2}$ of severe traumas,
- mostly asymptomatic, right-sided heart failure, ARDS,
- **therapy:** supportive (mechanical ventilation, corticosteroids, diuretics).

Amniotic fluid embolism

thumb|300px|Embolizace amniové tekutiny

- embolism of amniotic fluid, fragments of trophoblast and decidua during difficult labour,
- material that has embolized is highly thrombogenic + activates coagulation,
- cause of death in 10 % of women in labour,
- there is **no specific therapy**.

Air embolism

- Caused by massive vein trauma located on the neck / complication of central venous catheter + surgeries in sitting position,
- leads to immediate loss of consciousness,
- **therapy:** positioning the patient on the left side, head aiming downwards → moving the air bubbles from the right chamber + catheterization / punctum elimination of the air bubbles, hyperbaric oxygenotherapy,
- Lethality up to 50 %.

Septic embolism

- Abdominal abscesses, infectious endocarditis in i.v. addicts,
- **therapy:** ATB, surgical.

Tumor embolism

- Embolism of tumorous tissue / myxoma near the left atrium,
- acute / subacute pulmonary embolism.

Foreign object embolism

- Complication caused by invasive catheterizations, surgeries, ...
- **therapy:** removal of the foreign object by catheterization.
