

Occupational vasoneurosis

Professional vasoneurosis occurs during long-term work with vibrating machines (pneumatic hammers, jackhammers, grinders, chainsaws).

- under the arterial muscle hypertrophy of the arteries of the fingers, vasospasm is more easily formed
- at work (especially in the cold + humidity) **whitening of the fingers + painful paresthesias**
- exceptionally skin trophic changes
- sometimes combined with oppression in the upper thoracic aperture / SKK
- muscles and bones can also be affected by vibrations
- the difficulty is alleviated with the termination of the risky work
