

The cerebellopontine angle syndrome

The **cerebrospinal angle** is the space between the cerebellum and the pons, which is filled with cerebrospinal fluid and is a very common site of vestibular schwannoma. Expansion in that area accounts for 10% of all intracranial tumors and causes a set of symptoms we call pontocerebellar angle syndrome.

Content of the pontine angle

- cranial nerves: n. facialis, n. vestibulocochlearis
- flocculus
- lateral recess of the fourth cerebral ventricle

Symptoms

- cerebellar syndrome
- peripheral paresis of VII.
- ipsilateral impairment of the corneal reflex
- balance disorders
- hypacus
- tinnitus
- vertigo
- nystagmus
- diplopia

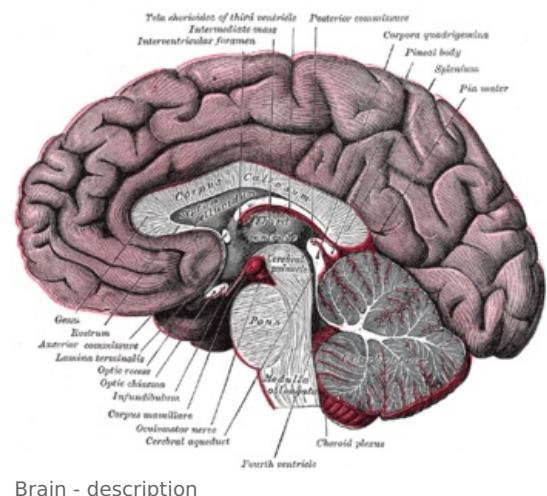

Causes

- schwannoma n. VIII.
- meningioma
- epidermoid
- cerebellar astrocytoma
- glomus jugulare
- metastases
