

# Two-time two-phase imprint

Other names for this imprinting technique are: **double imprinting method, correction imprint.**

**Two-time two-phase imprint** (correction) A two-stroke two-phase imprint is so named because the imprinting is performed twice (each time the mass is in a different consistency - phase).

- **The first imprinting** is performed with an impression compound of putty consistency (solid, heavy, putty types).
- **The second imprinting** is performed with an impression compound of the consistency of a thin cream (light, body, wash).

Between the first and second impressions, the first impression must be adjusted so that a second impression can be made on it. Adjustment consists of removing sub-curvatures, creating drainage grooves and shortening the edges.

Two-time two-phase imprint (corrective)
