

Utilization of glycerol

Glycerol obtained by **hydrolysis of triacylglycerols** is involved in energy metabolism through the intermediates of glycolysis or gluconeogenesis. The first step is its phosphorylation to **glycerol-3-P** by **glycerol kinase**. It is followed by its dehydrogenation to **dihydroxyacetone-P** catalyzed by **glyceraldehyde-3-phosphate dehydrogenase**. The latter represents an intermediate product of glycolysis/gluconeogenesis.
