

# Visible radiation

Visible radiation , or light, is the visible part of electromagnetic radiation. Its **frequency** ranges from **3.9 x 10 14 Hz** to **7.9 x 10 14 Hz**. The **wavelengths** correspond to the interval **390 nm - 760 nm**.

## The effect of visible radiation on the organism

**Visible radiation** acts on the organism through various mechanisms. Short-wavelength components (blue and violet areas) cause **photochemical effects** , which can manifest themselves on the skin especially in more sensitive people ( photodermatoses ), in certain diseases ( porphyria ), or after administration of certain drugs ( sulfonamides ). The red area, with its effects close to infrared radiation, has a **thermal effect** , which can cause the body to overheat.

Of course, light also affects the periodicity of **vital functions** (body temperature, blood pressure, sleep, hormonal and metabolic processes). **Psychosomatic effects** depend on the intensity and quality of light, the effect of colors on the psyche and perception of the surroundings is also known.

## Visible light in therapy

Usage is not great. The interest in light falls more into the field of lighting hygiene , which deals not only with the lighting of workplaces and households, but also its effect on the human psyche. Visible light is used, for example, in the treatment of depression .
